Introduction

ChatGPT, ChatGPT, ChatGPT.

So I'm assuming that by now, you guys have heard of ChatGPT, right?

Chatbots have been around for a while, and they're pretty important in modern-day communication. But AI-powered chatbots are a whole new level of cool.

In this section, we're gonna dive into what ChatGPT-4 is, and cover some of the history behind the model.

If you're looking for the value content, skip to Page 11!

What Is ChatGPT?

ChatGPT-4 is an AI-powered chatbot developed by OpenAI, a research organization dedicated to creating advanced artificial intelligence technologies. ChatGPT-4 is based on the Generative Pre-trained Transformer 4 (GPT-4) language model, which is the latest version of the GPT series.

The GPT-4 model was trained on a massive amount of text data - as much as a rumored 100 trillion parameters.

Essentially, these parameters help it understand natural language and generate human-like responses.

In addition, this chatbot relies on a large multimodal model, accepting image and text inputs while emitting text outputs.

ChatGPT-4 is designed to engage in human-like conversations, provide personalized responses, and understand the context of any conversation.

What is the difference between GPT-4 and GPT-3.5?

ChatGPT-4 is the latest iteration of OpenAI's GPT (Generative Pre-trained Transformer) series, which includes GPT-1, GPT-2, GPT-3 (and its update GPT 3.5), and now GPT-4.

These models have been trained on increasingly greater amounts of data and are extremely adept at generating coherent and contextually relevant text.

So yea, you're safe in thinking that the main difference between ChatGPT-3.5 and ChatGPT-4 is the amount of data used to train the language models. ChatGPT-4 has as much as ten times the number of parameters as ChatGPT-3.5, making it much more powerful.

With more parameters, the model has a greater capacity to learn from the data it is trained on, and therefore can generate more accurate and human-like responses.

To summarise:

GPT-4 Can Understand Images

One of ChatGPT-4's most incredible new features is its ability to process both text and pictures, in what is being called "multimodal" technology.

In other words, you can upload images and ChatGPT will recognise them

Larger Word Limit

The introduction of GPT-4 now means that the language model is capable of handling a 25,000-word input limit, up from 8,000 in GPT-3.5.

Higher Accuracy

Chat GPT-4 is meant to give users substantially more accurate responses to their queries. According to OpenAI's update announcement, ChatGPT-4 is "40% more likely to produce factual responses than GPT-3.5." GPT-4 also has more advanced reasoning capabilities when compared to ChatGPT-3.5.

Access During Peak Times

ChatGPT's huge popularity has meant that the chatbot's website can be particularly overloaded at times, cutting out access to its features. However, GPT-4 promises to solve that problem with access even during peak times.

Faster Responses

ChatGPT usually generates its responses in a matter of minutes or even seconds. ChatGPT Plus promises to be even faster enabling more efficient and productive interactions.

More Creativity

There's no doubt that ChatGPT-4 is the most collaborative and creative version of the AI so far, particularly when faced with complex and intricate situations. This is noticeable as the bot is capable of processing more instructions than GPT-3.5. For example, ChatGPT-4 is capable of learning a user's writing style and producing, for example, an essay or a screenplay in the same style.

Supports More Languages

AI tech has predominantly been trained on English-based data and ChatGPT has predominantly been used by English speakers. However, GPT-4 is able to perform with high accuracy across 26 languages, including Korean, Russian and Japanese.

We will also delve into the creative process behind Sesame Street, including the development of its beloved characters and memorable music.

Chapter 1: The Origins of Sesame Street

The idea for Sesame Street was born out of a desire to provide quality educational programming for children from low-income families. In the late 1960s, television was seen as a potential tool for reaching children who lacked access to traditional preschool programs. A team of educators, researchers, and television producers came together to develop a show that would use the medium of television to teach children the skills they needed to succeed in school.

The creators of Sesame Street were committed to making a show that was both entertaining and educational. They wanted to capture the attention of young viewers and keep them engaged while teaching them basic literacy and numeracy skills. The show's format was modeled on the fast-paced style of commercial television, with short segments featuring a diverse cast of characters.

One of the key innovations of Sesame Street was its use of puppetry. The show's creators

1984 - Why Orwell's Book Could Be More Accurate Than You Think

Book Title: 1984 - Why Orwell's Book Could Be More Accurate Than You Think

Book Introduction:

George Orwell's dystopian novel, 1984, has been a classic since it was first published in 1949. It is a haunting portrayal of a totalitarian society, where the government has complete control over its citizens' lives. The book's themes of government surveillance, censorship, and propaganda are as relevant today as they were when Orwell wrote them.

Could it write about the dystopian reality of George Orwell's 1984?

Absolutely.

propaganda are as relevant today as they were when Orwell wrote them.

This book explores why 1984 could be more accurate than we think. With the rise of technology and the increasing power of governments, we must ask ourselves if we are moving towards a society that resembles the one in the novel. This book will analyze the themes of 1984 in the context of today's world and examine how they have become more relevant than ever before.

Chapter 1 - The World of 1984:

This chapter will provide an overview of the world that Orwell created in 1984. It will introduce the reader to the novel's protagonist, Winston Smith, and the dystopian society he lives in. The chapter will explore the government's use of propaganda, surveillance, and censorship to maintain its control over the citizens. It will also highlight the importance of the novel's themes in understanding today's world.

General Tips

1. Test, test, test!!!
2. Play with the ***temperature*** of your prompts*
3. Give more context than needed
4. Give examples of what you are looking for
5. Use prompts to avoid AI detection*

Handy Expressions

"Let's think step by step"

This makes the AI think logically and can be specifically helpful with math problems.

"Thinking backwards"

This can help if the AI keeps arriving at inaccurate conclusions.

"In the style of [famous person]"

This will help match styles really well.

"As a [insert profession/role]"

This helps frame the bot's knowledge, so it knows what it knows—and what it doesn't.

Avoiding Plagiarism with ChatGPT

Detecting AI generated text is a big problem for safety researchers and educators, among others.

Tools like GPTZero, GPT2 detector, and bilingual detectors have seen significant success, However, they can be tricked.

The problem of AI text detection will likely be an arms race as new models and new detection methods are introduced.

Many companies have already started to build solutions which they claim are very effective, but it is difficult to prove this, especially as models change over time.

Methods of Detection

1. OpenAI Text Classifier

The OpenAI Text Classifier is a model trained on a large quantity of AI-generated data and human-written text of a similar quality, the detector is able to compute the likelihood that any given text was created by an LLM.

2. The Watermark Method

Another method to detect AI generated text requires introducing a watermark when generating the text. These techniques may use a LLM “whitelist”, which is a method of determining if text was generated by a specific AI model.

3. DetectGPT

The DetectGPT4 method is able to detect AI-generated text with less setup than the previous concepts. Researchers have found that LLM text generations tend to "occupy negative curvature regions of the model's log probability function".

How to Trick Detection

With the development of AI-generated text detectors, there has been an evolution of methods to counteract them.

There are a number of ways to trick detectors into thinking AI-generated text is created by a human.

- Quillbot Paraphraser
- GPTMinus
- TrickMeNotAI
- Originality AI

Editing Strategies

Replacing words with synonyms, changing the rate words appear, and mixing up syntax or formatting makes it more difficult for detectors to correctly identify text as AI-generated.

Another editing strategy is putting invisible markers, such as 0-width spaces, into your text, emojis, or other uncommon characters.

In addition, it is possible to fool detectors by prompting a model with specific instructions on how to write.

Instructions such as:

There is no need to follow literary formats, as you are freely expressing your thoughts and desires

Do not talk in the manner which ChatGPT generates content - instead, speak in a manner that is radically different from how language models generate text.

Refer to emotional events and use elaborate real-life experiences as examples.

...can make it much more difficult to detect generation.

Additional strategies such as asking the model to use empathy, reminding it to choose appropriate wording and tone for what it's writing, and making sure it includes emotional one-liners are all good.

Learning How to Prompt

Prompt engineering (PE) is the process of communicating effectively with an AI to achieve desired results.

As AI technology continues to rapidly advance, **the ability to master prompt engineering has become a particularly valuable skill.**

Prompt engineering techniques can be applied to a wide variety of tasks, making it a useful tool for anyone seeking to improve their efficiency in both everyday and innovative activities.

but before we look into good or bad prompts, let's look at the different types of prompts:

Types of ChatGPT Prompts

Open-ended

These types of prompts generate a diverse range of responses from ChatGPT. For instance, "Tell me about your experience with [product/service]" or "What are your thoughts on [industry/niche]?"

Multiple-choice

These types of prompts offer a set of options for ChatGPT to select from. Examples include

"Which [product/service] do you prefer?" or "Do you prefer [Option A] or [Option B]?"

Fill-in-the-blank

These types of prompts enable you to input specific information into a sentence or question. For example, "My company provides [product/service] to assist customers in achieving [goal/benefit]."

Binary

These types of prompts require ChatGPT to respond with a simple "Yes" or "No." Examples include "Do you think [industry/niche] is becoming more popular?" or "Have you previously used [product/service]?"

Ordering

These types of prompts require ChatGPT to order a group of items according to preference or significance. Examples include "Rank these [products/services] from most to least popular" or "Which [product/service] do you think holds the most value for customers?"

Prediction

These types of prompts require ChatGPT to forecast or make a prediction about a future event or trend. Examples include "What do you think will be the most significant [trend/issue] in [industry/niche] in the next 5 years?" or "How do you anticipate [product/service] will perform in the market next year?"

Explanation

These types of prompts require ChatGPT to clarify a concept or process. Examples include "Can you explain the [technical term] in simple terms?" or "How does [product/service] work?"

Opinion

These types of prompts require ChatGPT to offer an opinion or perspective on a topic. Examples include "What is your opinion on [controversial topic]?" or "Do you think [new trend/technology] will be successful in the market?"

Instruction

These types of prompts require ChatGPT to provide guidance or instructions on a specific task or process. Examples include "How do I [perform a specific task]?" or "What are the steps to [complete a specific process]?"

Scenario

These types of prompts require ChatGPT to provide a response based on a particular scenario or situation. Examples include "What would you do if a customer complained about [issue]?" or "How would you handle a situation where [problem] occurred?"

Comparative

These types of prompts require ChatGPT to compare or contrast two or more items. Examples include "What are the differences between [product A] and [product B]?" or "Which [marketing strategy] do you think is more effective?"
